

Delivering gigabit-capable broadband to existing developments

Do you have the fastest service your broadband provider can supply, but find it's still too slow for your needs?

This may be because you are located in:

- An area where the infrastructure isn't capable of faster speeds due to technology type or distance from infrastructure
- A new residential or commercial development where the developer has not opted for a gigabit-capable full fibre service
- An area where the commercial market doesn't currently plan to upgrade
- A city centre apartment block, previously used for another purpose
- A rural community
- A difficult to reach location (geographical factors)

In cases like these, there are a number of options which could improve the broadband speeds available. These include:

- **Coming together as a community and progressing a group solution:**
